A note on the organization of the Figures

One of the main goals of this research has been to assemble a consistent body of primary sources by which to buttress the historical narratives and interpretations made throughout the thesis on the urban modernization process of Macao. These written and drawn primary sources were the base, and necessary complement, of the interpretative work of mapping which I have produced in order to illustrate the history of urban transition in Macao. In this sense, this thesis is both a written and graphic manuscript, aiming at establishing a more integrated perspective over the urban transitions at hand, be it in terms of social, political, or techno-scientific intent. The present Volume 2 compiles the graphic part of this endeavor.

As outlined in the “Mapping urban transition” section of the Introduction (Volume 1), this study relied on a vast collection of documentation on public works from the 1830s to the 1920s, gathered as thoroughly as possible. This included contemporary written sources, published and unpublished, such as correspondence, survey and individual project reports, legislation, public speeches, to cite a few. Within the written sources, though, the drawings definitely took center stage: topographical and cadastral surveys provided information on the stages of evolution of the urban morphology throughout the transformation process; rough drawings and project plans inform on how the same transformation process was being envisioned. Frequently complemented by written reports, these plans were key to unveiling the techno-scientific experts’ convictions in terms of urban intervention. Cross-referencing the successive surveys with the projects allowed us to reflect on the often difficult and contradictory process of adapting the technicians’ urban theories to the physical and social reality of the city. Contemporary photography was also an indispensable source for cross-referencing survey maps. For instance, when a particular stage of evolution was absent from the available contemporary cartography, I have resorted, through cross-referencing historical photography and written information, to recreate its probable morphological configuration on plan.

In order to achieve a consistent degree of precision in the exercise of reconstituting the past urban form, I have relied on a method of graphic interpretation based on the role of drawing as an exploratory instrument to produce a sort of reverse engineering of the city. This included superimposing the information contained in the historical maps with the present-day vector general map (2015), so as to interpret the city design at different times under common morphological baselines, deconstructing the project intents at each phase, and reconstructing its evolution.¹ This

¹ For more on this method of graphic interpretation, see the “Mapping urban transition” section of the Introduction (Volume 1).

method of synthesizing the cross-referencing work of the primary sources through drawing was also useful to reconstitute a dependable chronological timeline, through which it became possible to attribute dates and authorships to different types of sources that hitherto have remained undated or anonymous. The same reasoning was applied, for example, to certain public works or housing projects which, once coherently placed in this reconstituted timeline, could be plausibly attributed to a particular authorship and/or production date.

This Volume debuts with an introductory set of illustrations pertaining to the Macao peninsula general geographical location in the nineteenth century (Figs. 1 to 4). A compilation of the above-mentioned selected general historical maps follows. The choice of these maps was guided by the intention of illustrating, with an important level of morphological detail, significant stages of evolution in regard to the transformations at hand. Therefore, the selection starts with the 1838 topographical map of the Macao peninsula by Cândido António Ozório (Fig. 5), marking the ‘before’ stage or, in other words, the urban configuration immediately before the start of the modernizing process. This is followed by the ‘mapping of transition’ through the 1866 land and sea survey by W. A. Read (Fig. 6),² the 1884 inner harbor improvement project by Adolfo Loureiro, which is based on an original 1880 city survey by Demétrio Cinatti (Fig. 7),³ the 1889 published survey by António Heitor (Fig. 8), and the also published 1912 survey by the Macao cartography committee (Fig. 9). Rounding up this map collection is the 2015 vector general map of the Macao peninsula by the SAR government public works department (Fig. 10), which served as the reference plan for the interpretative mapping work.

The subsequent collection regroups precisely the transposition of the morphological information emerging from each of the historical maps into the 2015 reference map. The cartography thus produced is named ‘interpretation’, in order to convey the required stages of appropriating the morphological information and restituting it through the drawing process, both conducted as rigorously as possible. As a sort of visual ‘table of contents’, it features the location of the districts whose transformations will be detailed in the chapters of the thesis, such as the Chinese Bazaar, setting for Chapters I, II and IV (Figs. 11 to 15), the Horta da Mitra, Volong and S. Lázaro suburbs, as well as the Patane district, respectively the settings for Chapters III and V (Figs. 13 to 15). In this collection is also introduced the color code which I have adopted throughout the thesis’ mapping work: the color red represents urban transformation and expansion; the color blue represents urban and infrastructural projects.

After a final introductory collection dedicated to the 2005 Historic Center of Macao’s inscription on the World Heritage List, which we will detail in the next section, the subsequent collections of

² For more on Figures 5 and 6, see Chapter I (Volume 1).

³ For more on Figure 7, see Chapter V (Volume 1).

figures are organized by chapter. As each of the five chapters is focused on a particular district or improvement project, I have opted for producing separate specific sets of detail maps depicting the stages of each individual transformation process. In the first three chapters, this set of maps is featured at the top of the respective collection of figures, laid out on the same page in a chronological sequence, with the purpose of conveying, at a glance, a clear and integral picture of the urban transformation discussed in that chapter (see, for instance, the chronological board for Chapter I regrouping Figs. 19 to 22). At the scale of the detail map, I have engaged in producing what I have called ‘configuration hypotheses’, depicting some of the key intermediary stages of the transformation process which aren’t featured in the historical cartography. This original mapping work is primarily based on the comparative ‘interpretation’ of the selected historical maps, with which is cross-referenced the information from other primary sources. The typical chronological board is thus composed of excerpts from the afore-mentioned general interpretation reference maps, which are dated accordingly, and of these ‘configuration hypotheses’, which are dated as ‘circa the specific year’, to stress their intermediary character.

In what concerns Chapters IV and V, however, as their respective topics pertain more to the analysis of successive restructuring projects than to continuous processes of morphological evolution, I have abandoned this introductory chronological board format in favor of the linear organization of the figures in the order they are mentioned in the main text. In these latter chapters, the mapping work had to do mainly with transposing the morphological information emerging from the projects themselves, both in terms of restructuring intentions and of underlying cadastral surveys, into a common reference, in order to facilitate a comparative analysis. The final cartography often resulted in new ‘cadastral and restructuring configuration hypotheses’ based on the interpretation of the projects, cross-referenced with the appropriate general interpretation maps, themselves based on the 2015 general map. A heavy layering of morphological information, to be sure, but which hopefully resulted in an expressive production of original cartography illustrating ‘the forms’ of urban modernity in Macao.

The general purpose of this organization, as well as of the accent put on the mapping work, is that the Volume 2 - Figures may stand on its own, not just serving as an appendix for the main text, but constituting rather a visual narrative of urban transformation in its own right.
